Pie Chart

A pie chart is an effective visualization choice for comparing two variables it clearly highlights the dominance of one variable over the other. In this case, it displays the greater Influenza Mortality death rate in populations over 65 years plus.

Bar Chart

The bar chart, which includes all fifty states plus the District of Columbia, feels overloaded despite its ability to sort and display data in ascending or descending order. This type of chart is more effective when used for a smaller number of bars, such as the top five states.

Tree Map

The treemap chart is ideal for illustrating the distribution of death counts by state as part of a whole. It allows us to categorize states based on their death counts, using squares of varying sizes and different colors for visualization. However, not enough space is available to clearly label the states with the lowest death counts.
