Tableau link: [Tableau Influenza Deaths by State](#)

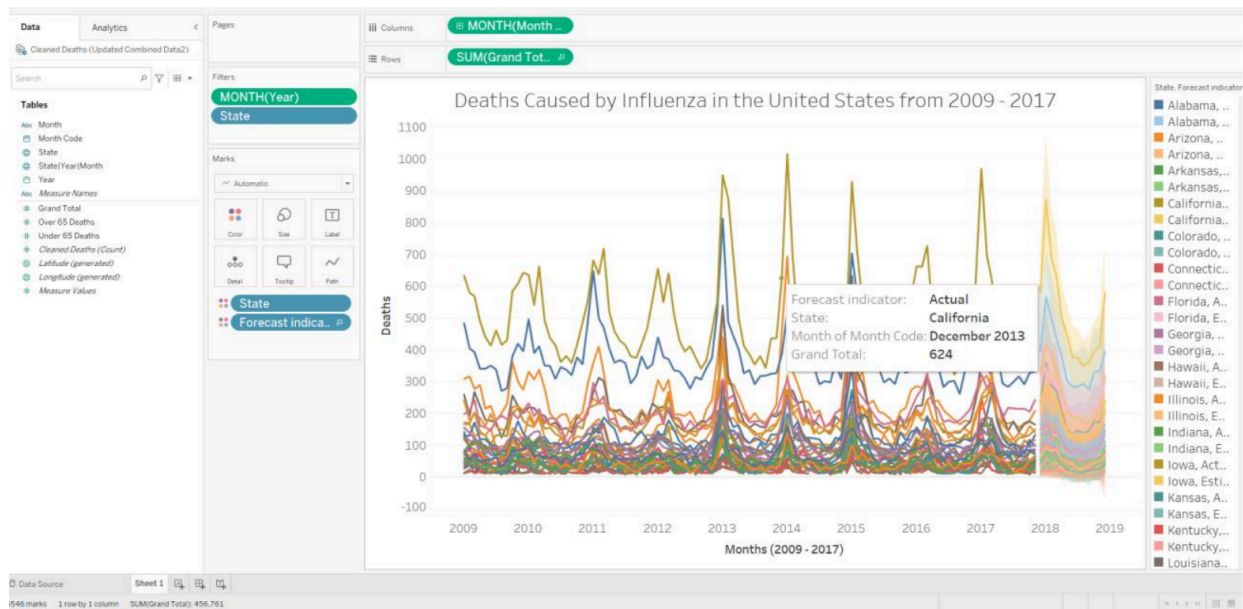

The line graph below displays the total number of influenza deaths in the United States from 2009 to 2017. Although the data is segmented by year, the graph remains cluttered, making it difficult to distinguish states with fewer deaths due to the large number of data points.

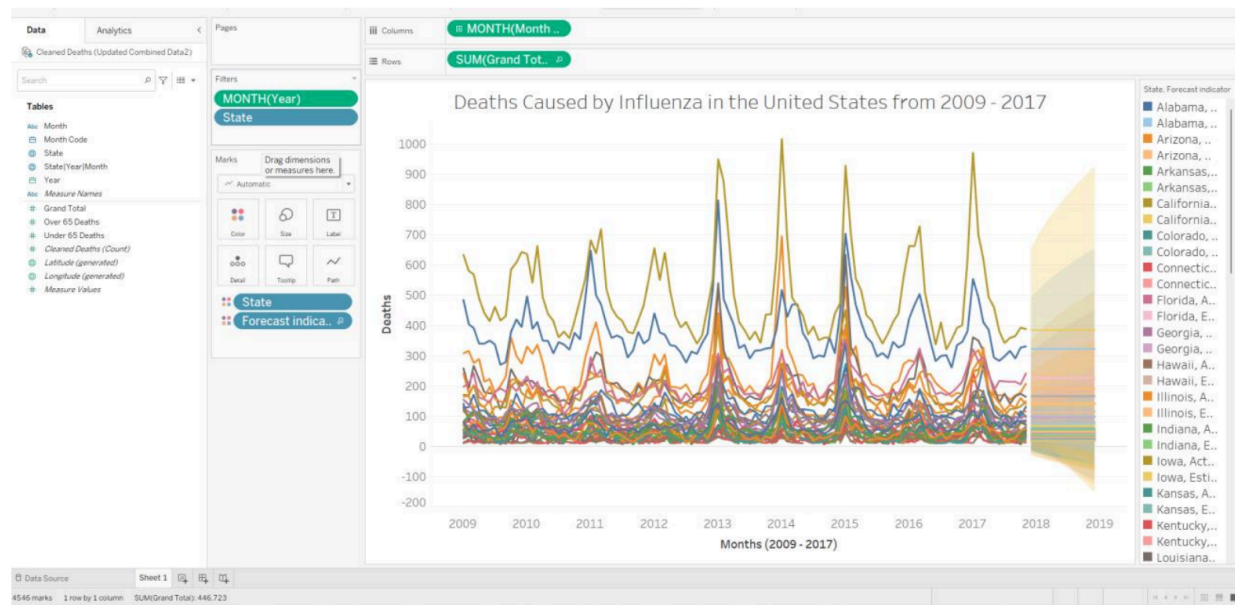

When we plot the data with months along the x-axis, a clear seasonal trend becomes evident:

Forecast with Seasonality

Forecast without Seasonality

The primary issue with the line chart showing influenza deaths across all 50 states is the excessive number of data points. To address this, I would group the data by region in the U.S., reducing the number of points while also clustering areas with similar geographic characteristics.

Visualization by Region
