Scatter Plot

Based on the R-squared value of 0.89778 in the scatterplot, I calculated the Pearson correlation coefficient to be 0.94.

Since this coefficient is close to +1, it indicates a strong positive correlation between a state's elderly population (ages 65 and older) and the number of influenza-related deaths in that state.

The scatterplot also shows that most data points are tightly clustered around the trend line, particularly in states with smaller elderly populations. However, as the elderly population increases, the data points become more dispersed from the trend line, though there are no significant outliers.

Bubble Chart

In the bubble chart, I grouped the states by region to minimize the number of colors used. The regions are based on the geographic divisions defined by the CDC and the U.S. Census Bureau (<https://www.cdc.gov/nchs/hus/sources-definitions/geographic-region.htm>).
